

AT-A-GLANCE: Application REstrictor (ARES)

Take Back Control of Your Software

THE CHALLENGE

Software providers have the upper hand when it comes to licensing. Let's say you purchase the optimum number of licenses for your company. If you accidentally exceed that number, you may end up paying thousands in overage charges due to "Trust-Based" licensing. You won't even know the extra fee is coming, preventing you from effectively planning finances. We think it's time to change that.

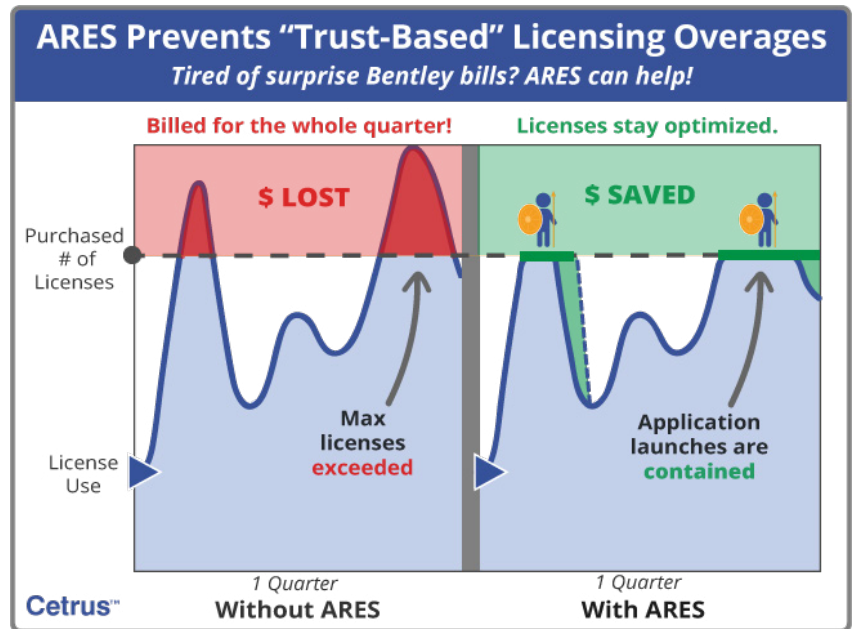

THE SOLUTION

Application REstrictor (ARES) is a new Plug-in to the Cetrus Process Meter (CPM) platform. When a user clicks on an application, ARES will restrict it from launching if the current number of running applications exceeds the maximum number of applications allowed. This will keep license use to the exact number purchased, preventing costly overages.

By running reports, companies can identify idle licenses, and manually release them for others to use. ARES gives you back control of your software, and helps optimize license use.

ARES KEY BENEFITS

- Control your application use
- Eliminate surprise bills
- Improve planning and asset management
- Manually release licenses
- Save \$\$\$

COMING SOON

Waitlist Plug-in: When an application is blocked through ARES, users will be able to join a Waitlist and receive an application availability notification.
